

## Timing verification of automotive communication architecture using quantile estimation

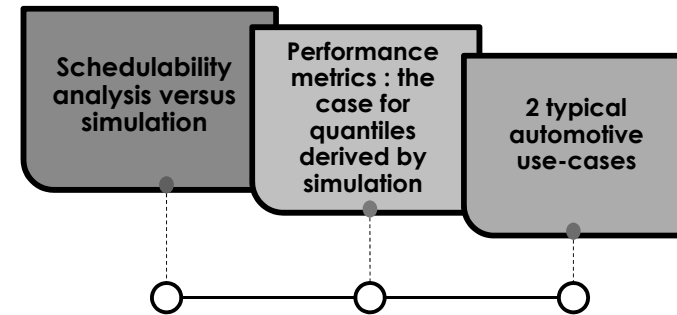

Nicolas NAVET (Uni Lu), Shehnaz LOUVART (Renault), Jose VILLANUEVA (Renault), Sergio CAMPOY-MARTINEZ (Renault) and Jörn MIGGE (RealTime-at-Work).

ERTSS'2014 - Toulouse, February 5-7, 2014.

February 07, 2014

## 1 Outline

- ✓ Early-stage timing verification of wired automotive buses – CAN-based communication architectures

## 2 Automotive communication architectures

- ✓ Increased bandwidth requirements & timing constraints
- ✓ More complex & heterogeneous architectures with black-box ECUs
- ✓ Optimized CAN networks for higher bus loads: priorities, frame offsets, gateways, communication stacks, etc
- ✓ Verification activity of higher importance today, higher load levels calls for more accurate verification models → no margin for errors
- ✓ Main performance metrics: frame response time = communication latency

**Schedulability analysis**  
"mathematic model of the worst-case possible situation"

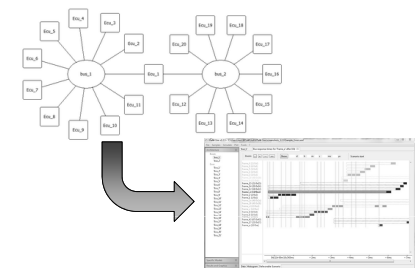

VS

**Simulation**  
"program that reproduces the behavior of a system"

$$K_i^k(t) \stackrel{\text{def}}{=} \left\lfloor \frac{J_i^k + \varphi_i^k(\phi^i)}{T_i^k} \right\rfloor + \left\lfloor \frac{t - \varphi_i^k(\phi^i)}{T_i^k} \right\rfloor + 1$$

max number of instances that can accumulate at critical instants

max number of instances arriving after critical instants

- ☺ Upper bounds on the perf. metrics → Safe if model is correct and assumptions met
- ☹ Often pessimistic → over-dimensioning
- ☹ Might be a gap between models and real systems! → unpredictably unsafe then

- ☺ Models close to real systems
- ☺ Fine grained information
- ☹ Worst-case response times are out of reach! Occasional deadline misses must be acceptable

RTaW : “enable designers to build provably safe and optimized critical systems”

- **Simulation and schedulability analysis for networks and ECU**  
CAN, CAN FD, Arinc825, Ethernet, FlexRay, AFDX, etc...
- **OEM customers:** Renault, PSA, Eurocopter, Astrium, ABB

- RTaW/Sim Starter edition can be downloaded from [www.realtimeatwork.com](http://www.realtimeatwork.com)

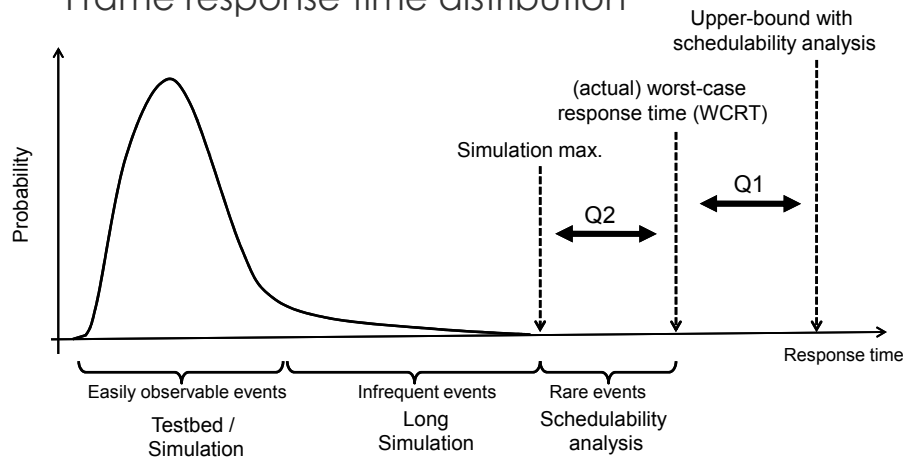

- No black box software: all schedulability analysis that are implemented are published

Used in this study  
RTaW-Sim → CAN simulator with schedulability analysis and configuration algorithms

# 2

## Metrics for the evaluation of frame latencies: the case for quantiles

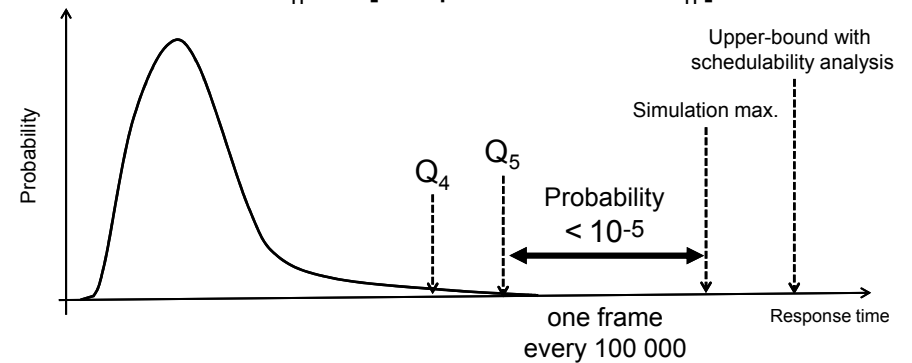

### Frame response time distribution

Q1: pessimism of schedulability analysis ?!  
Q2: distance between simulation max. and WCRT ?!

Using quantiles means accepting a **controlled** risk

Quantile  $Q_n$ :  $P[\text{response time} > Q_n] < 10^{-n}$

✓ No extrapolation here, won't help to say anything about what is too rare to be in simulation traces

## Identifying both deadline and tolerable risks

1. Identify frame deadline
2. Decide the tolerable risk → target quantile
3. Simulate “sufficiently” long
4. If target quantile value is below deadline, performance objective is met

## 1) Quantiles vs average time between deadline misses

Quantile	One frame every ...	Mean time to failure Frame period = 10ms	Mean time to failure Frame period = 500ms
Q3	1 000	10 s	8mn 20s
Q4	10 000	1mn 40s	≈ 1h 23mn
Q5	100 000	≈ 17mn	≈ 13h 53mn
Q6	1000 000	≈ 2h 46mn	≈ 5d 19h
...	...	...	...

Warning : successive failures in some cases might be temporally correlated, this must be assessed!  
Use of distributions of successive quantile overshoots, linear and non-linear dependency analysis

## 2) Determine the minimum simulation length

- ✓ time needed for quantile convergence
- ✓ reasonable # of values: a few tens ...

Min	Average	Q2	Q3	Q4	Q5	Q6	Max	Bound
0,236 ms	0,272 ms	0,466 ms	0,474 ms	0,477 ms	0,477 ms	0,477 ms	0,550 ms	
0,218 ms	0,315 ms	1,061 ms	1,481 ms	1,750 ms	1,875 ms	2,009 ms	2,035 ms	2,386 ms
0,522 ms	0,686 ms	1,490 ms	1,897 ms	2,116 ms	2,267 ms	2,388 ms	2,501 ms	4,890 ms

3,912 ms	3,983 ms	3,983 ms	3,983 ms	3,983 ms	3,912 ms	3,983 ms	3,983 ms	4,920 ms
3,491 ms	3,864 ms	3,864 ms	3,864 ms	3,864 ms	3,491 ms	3,864 ms	3,864 ms	4,920 ms
3,129 ms	3,181 ms	3,181 ms	3,181 ms	3,181 ms	3,129 ms	3,181 ms	3,181 ms	4,744 ms
3,451 ms	3,548 ms	3,548 ms	3,548 ms	3,548 ms	3,451 ms	3,548 ms	3,548 ms	4,920 ms
3,392 ms	3,532 ms	3,532 ms	3,532 ms	3,532 ms	3,392 ms	3,532 ms	3,532 ms	5,182 ms
3,315 ms	3,336 ms	3,336 ms	3,336 ms	3,336 ms	3,315 ms	3,336 ms	3,336 ms	5,094 ms
3,431 ms	3,817 ms	3,817 ms	3,817 ms	3,817 ms	3,431 ms	3,817 ms	3,817 ms	6,718 ms
3,511 ms	3,733 ms	3,733 ms	3,733 ms	3,733 ms	3,511 ms	3,733 ms	3,733 ms	6,772 ms
3,471 ms	3,587 ms	3,587 ms	3,587 ms	3,587 ms	3,471 ms	3,587 ms	3,587 ms	6,754 ms
3,412 ms	3,578 ms	3,578 ms	3,578 ms	3,578 ms	3,412 ms	3,578 ms	3,578 ms	6,718 ms
3,471 ms	3,416 ms	3,416 ms	3,416 ms	3,416 ms	3,471 ms	3,416 ms	3,416 ms	6,982 ms

Tool support can help here:  
e.g. numbers in gray should not be trusted

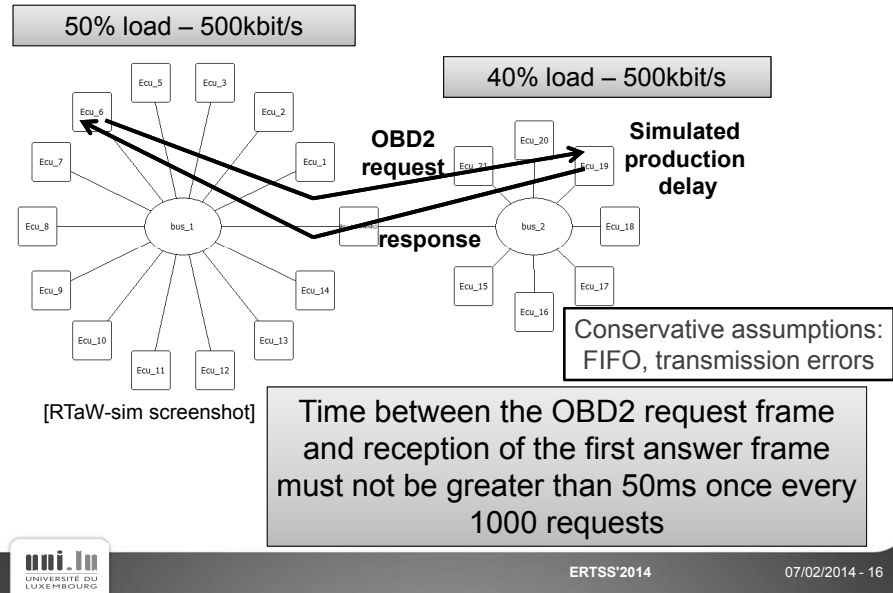

Reasonable values for Q5 and Q6 (with periods <500ms) are obtained in a few hours of simulation (with a high-speed simulation engine) – e.g. 2 hours for a typical automotive setup

[RTW-sim screenshot]

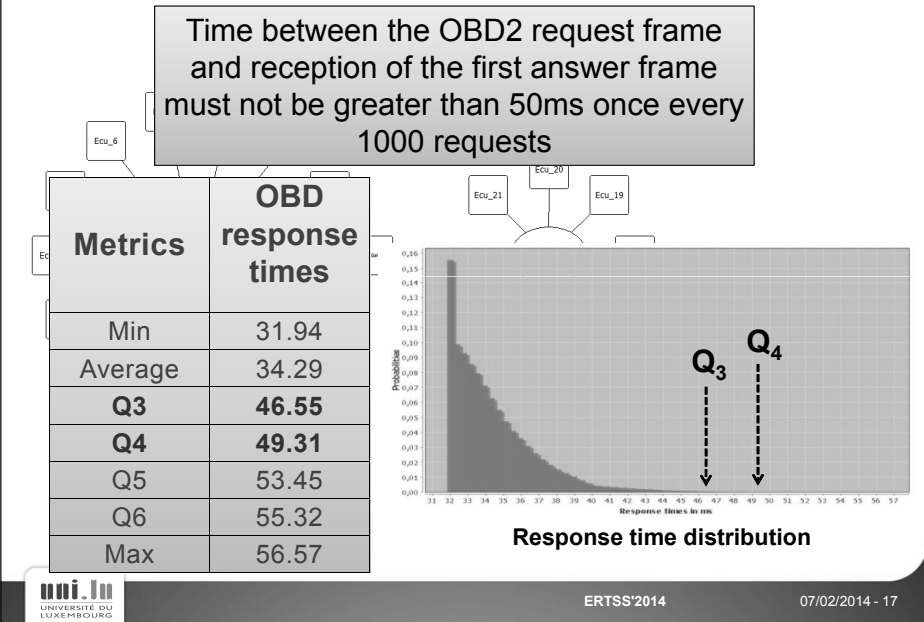

# 3

## Typical use-cases of quantile-based performance evaluation

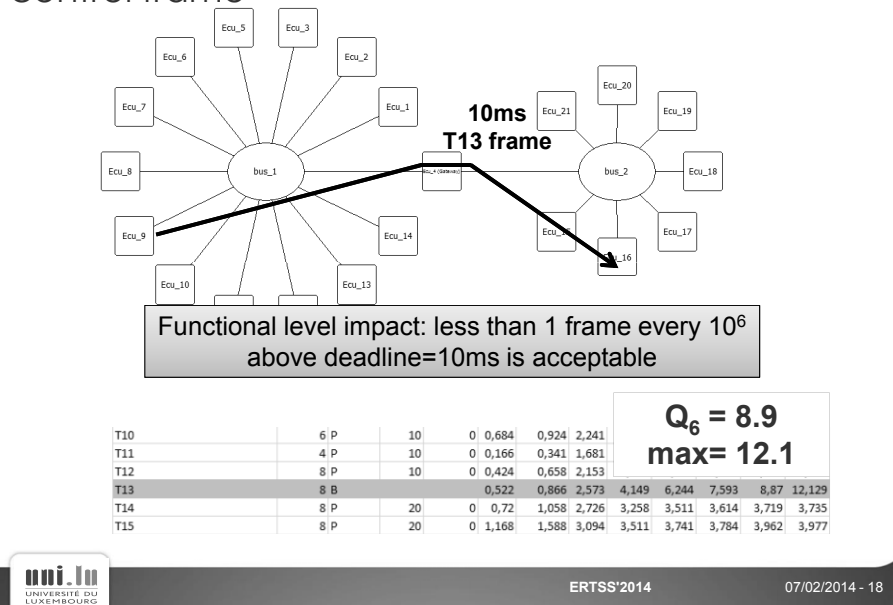

## Use-case 1: OBD2 request through a gateway

## Use-case 1: OBD2 request through a gateway

## Use-case 2: end-to-end response time of a 10ms control frame

## Concluding remarks

- Timing verification techniques & tools should not be trusted blindly
- Simulation is well suited to systems that requires timing guarantees but
  - ✓ Are not well amenable to schedulability analysis
  - ✓ Or can tolerate deadline misses with a controlled level of risk
- Some methodological aspects
  - ✓ Determine quantile wrt criticality, and simulation length wrt to quantile
  - ✓ Simulator and models validation
  - ✓ High-performance simulation engine needed for higher quantiles
